

Case Studies on the use of geospatial technology in the development sector

Part 4: Examples from **population and census planning**

Automatic creation of pre-enumeration areas

Challenges of enumeration area Delineation

- Traditional manual creation of EAs is resource intensive
- EAs can be outdated or incomplete, unavailable & require regular update
- Restrictions on survey access to high risk, conflict and violent areas

Automatic pre-EA creation tool

Input data

Splitting process

Merging process

Georeferenced layers

High-resolution gridded population data

How the PreEA tool works

Building blocks

Splitting units with total population

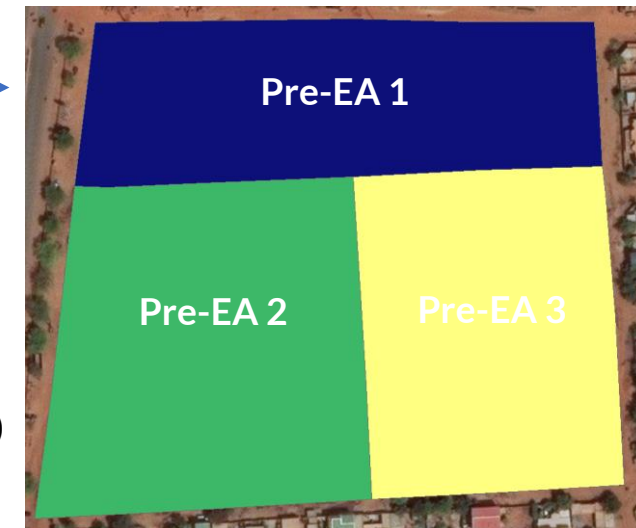

Hard Constraints:

- Population (Max & Min)
- Area (Max and Min)
- Uncrossable Border

Pre-Enumeration Area (EA) outline

Pre-EAs with total population

Soft Constraints:

- Target (Pop & Area)
- Homogeneity (Socio-economic)
- Shape (Compactness)

Example outputs of the pre-EA tool

Paraguay

Burkina Faso

Niger

Togo

Zimbabwe

Summary of the tool

- Create comprehensive national sampling frame of pre-enumeration areas
- User-defined rules/constraints on pre-EA creation
- Pre-EAs are a starting point, they must be checked and validated
- Developed under GRID3 by WorldPop

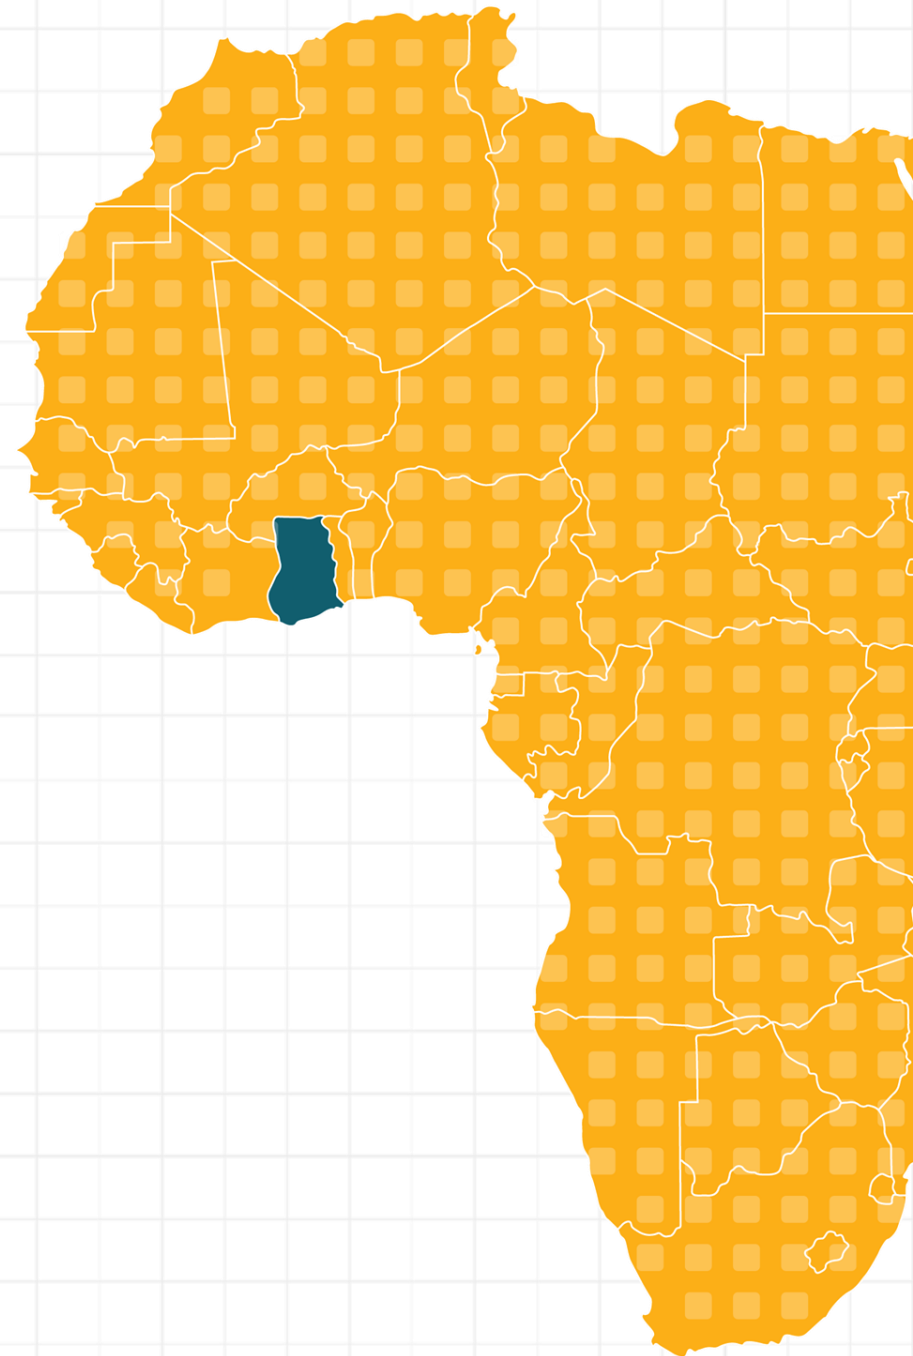

Automatic pre-EA creation tool

GIS support for census modernisation in Ghana

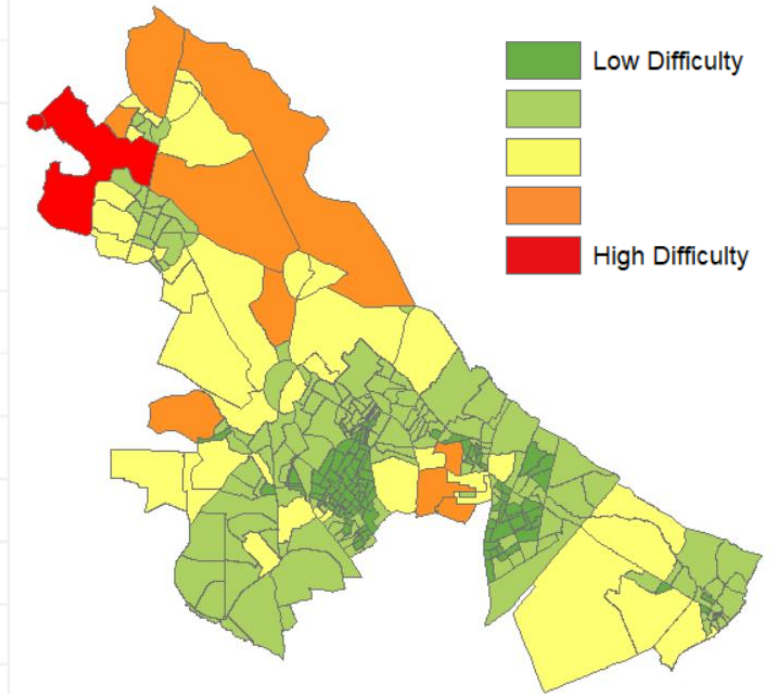

- Ghana Statistical Service (GSS) requested technical support and training in **geospatial data processing and analysis** for their census
- GSS Transitioning from manual procedures around data capture and processing, towards **digital geospatial alternatives**

Background

- **Hard-to-count" enumeration area (EA) indicators** - a means of estimating GSS enumeration effort in terms of resources and field staff
- GRID3 Flowminder-led engagement
- is strengthening the capacity of GSS to assess and validate enumeration areas in order to **reduce the number of people 'missed'** by enumerators

Example of a district

Red indicates problems such as the area being too large or difficult to access due to forest cover or other factors; these problems may have an impact on coverage by census teams

"Hard to count" indicators

Geometry indicators

- Area of EA
- Polsby-Popper score (boundary complexity)

Accessibility indicators

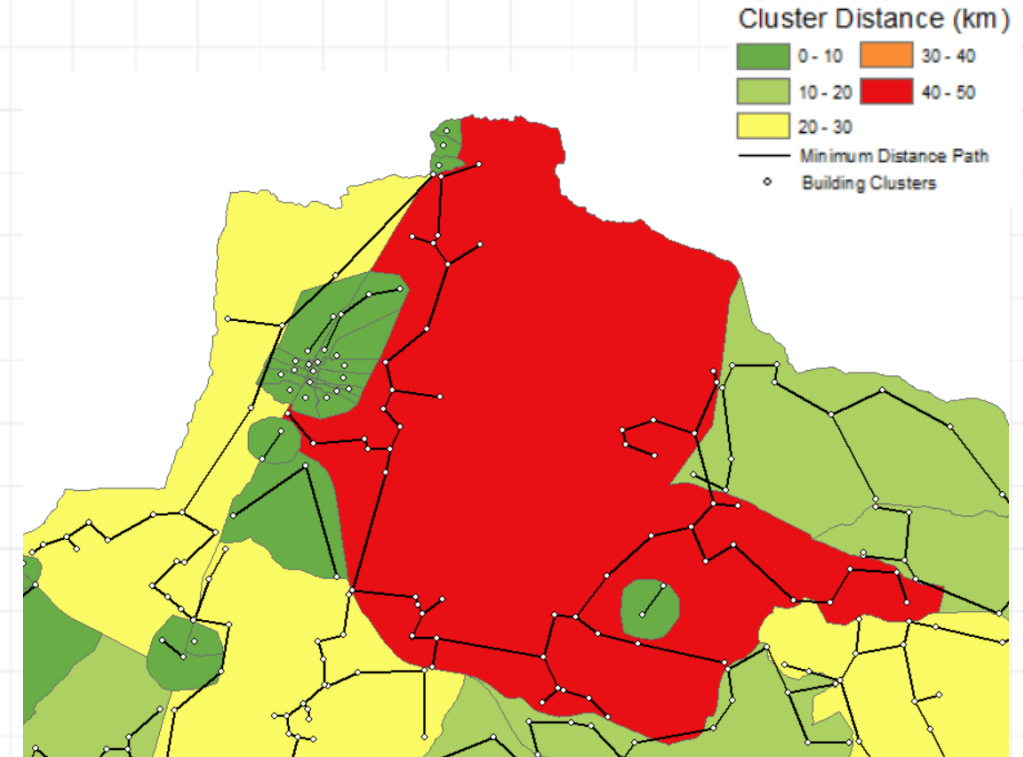

- Road density per EA
- % Tree cover per EA
- General accessibility per EA

Population and building indicators

- Number of buildings per EA
- Settlement cluster distance per EA
- Estimated population per EA

"Hard to count" indicators

Distance between groups of buildings per EA

The distance between defined "groups" of buildings. A higher distance is marked as high difficulty, as it means that there is more to travel between buildings.

Accessibility indicators

Percentage of tree cover per EA

Treecover 100m 2015
High : 100%
Low : 0%

"Hard to count" indicators
